cool it down

Powerful, efficient and energy-saving, the Fly ceiling fan from Rubine is the ideal complement to everyday life.

In Singapore's hot and humid climate, no home can do without some form of cooling system to make the weather more bearable. But function doesn't have to take over everything.

The Fly ceiling fan from Rubine will possibly be one of your best purchases for your newly renovated home. This 52-inch ceiling fan features five blades, a new generation DC motor, and a slew of features that will make your life so much easier.

Powerful winds to cool you

With a span of 52 inches and five ABS blades, the Fly ceiling fan is guaranteed to bring powerful and natural air movements into your home. There are six speeds to choose from, so you'll have complete control over the cooling effect.

To complement this further, the Fly fan also comes equipped with a smart

Temperature Sensor. Set your preferred threshold and the fan will automatically detect the surrounding temperatures and react accordingly. This allows you to reduce electricity consumption and save on your utility bills.

Next generation DC motor

The secret to Fly's powerful wind production lies in its technologically advanced DC motor. This innovative motor uses ultra-low energy yet still delivers a strong airflow with silent operation. Because of its high efficiency and top quality construction, the Fly fan is incredibly sturdy and durable with lower friction and less wear and tear. The motor is also designed to minimise temperature rise, so you can rest assured that the fan will not heat up even after prolonged use. Put all this together and you have a powerful yet energy-efficient motor that has an

impeccably long service life. In fact, the Fly fan comes with a 10-year warranty for its motor!

Full featured fans

The Fly ceiling fan is packed with state-of-the-art features that complement everyday life. A slim and compact LCD remote controller makes it convenient to control the fan, and it even has a built-in LED light that makes it easier to locate in the dark.

The ceiling itself comes equipped with a 24-watt ceiling light that is strong enough to illuminate a typical room. This energy-saving light, which can also be controlled by the remote, can be turned on to emit Warm, Cool or Daylight colour tones.
