water THERAPY

*Relaxing showers and baths
without the fuss come easy with
Rubine's slim water heater*

There's nothing quite like coming home to a relaxing shower after a tiring day, and it's essential that this precious alone time is made perfect. To ensure the quality and temperature of the water in use, your heaters are an important consideration – and Rubine offers one of the best in the market with its SH-20 SLIM HORIZONTAL water heater.

Available at a capacity of 20 litres, the titanium-tank heater is known for its small size and horizontal shape that can fit into even the smallest nooks and crannies – perfect for smaller homes, which are de rigueur in Singapore. Designed with ease in mind, it comes with sturdy mounting that can be installed on a tight slab, as well as a LED-light heat indicator that changes colour from purple to blue as the temperature reaches the optimal level over 20 minutes, to a maximum

working temperature of 75 degrees Celsius.

Having been certified in Japan for its Ag+ antibacterial properties and awarded the SIAA ISO 22196, the global standard for antibacterial efficiency, homeowners can be assured of the lack of bacteria within the appliance – silver ions from the SH-20 SLIM HORIZONTAL water heater will be able to inhibit the growth of such harmful microorganisms. When eventual descaling is required, a specialised outlet allows one to do so without difficulty.

The focus on hygiene and size aside, it also offers a number of safety features that makes its use hassle-free. The SH-20 SLIM HORIZONTAL water heater's built-in over-pressure protection ensures that excess pressure in the tank can be released through a pressure relief valve, and the hot water and accompanying splash is

made to be contained within the appliance to prevent possible accidents, through its splash-proof safety rating.

Further protection was done through a dry heat safety component, where the tank automatically switches off when water has run out or the inlet tap is switched off. And if one is worried about possible overheating despite these measures, the thermostat can be manually reset, and clear indication of the temperature within observed through the LED-light indicator.
